

## **Drehmomente NM Chilli Pro Scooter**

The correct tightening torque is crucial for safety and reliability in a wide range of applications. Insufficient tightening torque can lead to loosening, while excessive torque can result in material damage or even breakage of the screw. To ensure reliability, the torques specified by the manufacturer must be adhered to. This requires the use of calibrated torque wrenches. Regular inspection and maintenance is essential to ensure that the correct tightening torque is applied. Ultimately, this not only contributes to safety, but also extends the service life of the components.

### **Compression System :**

- SCS : 15NM
- HIC : 15NM

### **Clamp Screws : 18NM**

- SCS : 18NM
- HIC : 18NM

**Wheel Axis Front: 35NM**

**Wheel Axis Rear: 35NM**

**Brake Screws: 8NM**
